CLAIMS

What is claimed is:

- 1. A system that facilitates extending the functionality of an application, comprising:
- a schema component that includes a schema element representative of domain terminology of a problem to be solved; and
- a mapping component that maps the schema element to a construct of a host application programmable interface (API).
- 2. The system of claim 1, the API is associated with at least one of a word processing application, spreadsheet application, drawing application, presentation graphics application, website design and development application, database application, project management application, publication application, note management application and, browser and communication application.
- 3. The system of claim 1, the schema component facilitates generation of at least one of a data programming model and a view programming model.
- 4. The system of claim 1, further comprising a generation component that generates at least one of a data programming model and a view programming model.
- 5. The system of claim 1, further comprising a generation component that generates a data programming model and a view programming model that are automatically connected to each other *via* data binding.
- 6. The system of claim 1, further comprising a generation component that generates at least one of a data programming model and a view programming model, wherein the data programming model interfaces to the host API *via* the view programming model.

- 7. The system of claim 1, further comprising a separation component that separates data from document content.
- 8. The system of claim 1, further comprising a separation component that generates a data island in a document of a host application.
 - 9. The system of claim 8, the data island is editable.
- 10. The system of claim 8, the data island can be at least one of accessed and modified without launching the host application.
- 11. The system of claim 8, contents of the data island and contents of the document are synchronized when the document is run inside the host application *via* data binding.
- 12. The system of claim 1, the schema component and the mapping component facilitate generation of a new API that interfaces to the host API.
- 13. A computer readable medium having stored thereon computer executable instructions for carrying out the system of claim 1.
 - 14. A computer that employs the system of claim 1.
- 15. The system of claim 1, the schema component includes a view schema that represents only data of interest of a host application.
- 16. The system of claim 1, the schema component includes a view schema that facilitates pulling a plurality of objects of interest from a plurality of the host APIs.

- 17. The system of claim 1, at least one of the schema component and the mapping component facilitate generation of a view API that is a hybrid of view schema and the host API.
- 18. A system that facilitates extending the functionality of an application, comprising:

a schema component that includes a schema in terms of a problem to be solved and a mapping of the terms to generic objects of an API of a host application; and a generation component that generates at least one programming model based on the schema that interfaces to the API.

- 19. The system of claim 18, further comprising a separation component that generates an editable data island in a document of the host application.
- 20. The system of claim 19, contents of the data island and contents of the document are synchronized when the document is run inside the host application.
- 21. The system of claim 18, the schema component facilitates generation of a new API that interfaces to the API.
- 22. The system of claim 18, the schema component facilitates manipulation of a variable without reference to underlying register and stack allocations.
- 23. The system of claim 18, further comprising a separation component that generates an editable data island in a document of a host application, which data island is accessible and modifiable without running the host application.

24. A method of extending the functionality of an application, comprising: creating a schema of problem domain elements of a problem to be solved; mapping the problem domain elements to constructs interpretable by one or more generic application interfaces of the application; and

generating a program model based on the mapping of the problem domain elements such that the one or more generic application interfaces can be accessed *via* the program model using the problem domain elements.

- 25. The method of claim 24, further comprising automatically separating the program model into a data model and a view model.
- 26. The method of claim 24, further comprising exposing data of the problem domain elements as named objects in a view model.
- 27. The method of claim 24, further comprising exposing data of the problem domain elements as declarations in a data model.
- 28. The method of claim 24, the program model is a schema-based, machine generated model.
- 29. The method of claim 24, further comprising exposing data of the problem domain elements as first class named objects.
- 30. The method of claim 24, further comprising separating data from a view model of the program model by,

generating data that conforms to the schema; and saving the data as a data island in a document of the application.

31. A computer-readable medium having computer-executable instructions for performing a method for extending the functionality of an application, the method comprising:

creating a mapping of a schema to one or more generic application interfaces of the application;

generating a view model from the mapped schema, the view model includes view data that is mapped to objects of the application; and generating a data model from the mapped schema, the data model including data that is mapped to objects of the application.

- 32. The method of claim 31, further comprising data binding the view model to the data model.
- 33. The method of claim 31, the view model uses portions of the schema that are mapped to problem domain terms related to a problem to be solved.
- 34. The method of claim 31, further comprising extracting the view data that is mapped to objects of the applications and exposing the view data as view controls.
 - 35. The method of claim 31, the data model is generated by, conforming the data to the schema; and saving the data as a data island in a document of the application.
- 36. The method of claim 35, further comprising:

 connecting the data model to the data island; and

 synchronizing contents of the data island with contents of the document
 when the application processes the document.

37. A system that facilitates extending the functionality of an application comprising:

means for creating a mapping of a schema to one or more generic application interfaces of the application;

means for generating a view model from the mapped schema, the view model includes view data that is mapped to objects of the application

means for generating a data model from the mapped schema, the data model including data that is mapped to objects of the application; and

means for propagating changes to the data model to contents of a document *via* a data binding mechanism to view controls.
